

Back office

How would you like your back office to work? We know and embrace the fact that each operator is different. Some dislike having to log into several different back office provider applications, while others consider it a natural step in order to get access to full functionality.

Nolimit offers three different versions of our back office in order to give our operators freedom of choice. Of course, they all contain everything you need as an operator, and if you require anything else we'll happily build it for you.

The back office functionality can be loaded via a set of API services or through a complete reference implementation using the underlying API services. The third option is to inject selected (brandable) parts of the reference implementation into the operator's back office with a single sign-on solution.

The back office is simple in design but powerful in terms of content and functionality. The features include:

- Dynamic statistics from the player, operator or promotion level with graph functionality. These can drill-down all the way to the year, month, day, hour and game round level. Combination filters are possible for games, currencies and channels.
- Multi operator or multi brand access.
- A custom report section with instant execution, Excel export or subscriptions on a daily or monthly basis.
- A user section. Create your own users and assign access on an individual or group level.
- A promotion section with complete access to the Nolimit promotion toolbox, containing user groups, free bets, event-based triggers and enabling of features.

- A maintenance section for real-time maintenance options on the operator and game level.
- Support for operator specific configurations and multilingual text management.

The back office application runs in the cloud environment independently from any of the game servers. This means that it will never interfere with gameplay and that deployments of new versions can be done separately without any down-time.
