Platform

Nolimit has a solid and complete gambling platform that has been developed over many years. We now have the tools we need and a sense of freedom that has been missing when we've worked with other platforms – both on the provider and operator side.

As a team of well-versed developers, we are excited to finally offer flexible solutions and naturally extend our base to quickly adopt and create new trends and technologies. For us, the operator is the boss. This is why pride ourselves in always putting the operator first. No matter the operator's requirements, Nolimit can make it happen!

Nolimit has a fully distributed and lightweight architecture that has been built to handle huge loads in a production-tested combination of hardware and software. It can be used for various applications, but we have focused on online gambling and social media with high traffic loads. Unsurprisingly, the application's foundation is firmly focused on performance, security and stability, without being overly complicated. The Nolimit platform can be fully or partly deployed in the cloud.

The integration consists of a very simple HTTP/JSON API, in combination with a JavaScript bundle which is supported by Nolimit. The integration API has a few mandatory common services, but the true power lies in the many operator specific services that enable a closer interaction between the games and the operator's system. More specifically, it is especially powerful in areas such as promotions, game events, marketing and jackpots.
